

Site Blocking Efficacy – Key Findings

Australia

July 2018 | Australian Screen Association (ASA)

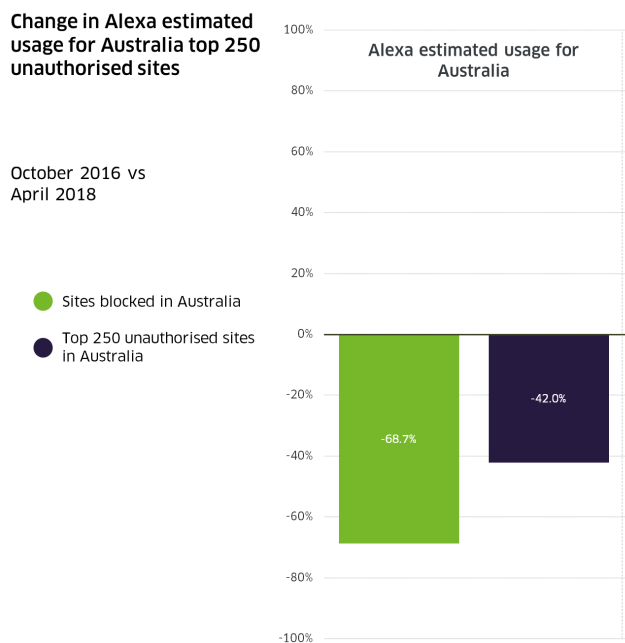

Key findings

The impact of site blocking in Australia has further increased following more frequent use of order extensions by applicants, resulting in a reduction in usage in Australia of the websites targeted by the blocking orders by 68.7% since October 2016, before the blocking regime began.

The key points from this report are as follows:

- Site blocking in Australia has resulted in an overall usage reduction of 68.7% to blocked sites when comparing usage recorded in April 2018 to before blocking took effect. Usage has decreased for each blocking wave implemented in the country;
- The usage of the top 50 sites in Australia has decreased by 50.4% since October 2016. This is 15.3% further than the 35.1% in the previous report;
- The graph below summarises the findings of this report and shows the change in usage for the top 250 unauthorised sites¹ in Australia over the recorded period of October 2016 to April 2018. The blocked sites have decreased in usage by a total of 68.7% in Australia. Overall usage of the top 250 unauthorised sites has decreased by 42% in Australia.

¹ Appendix C shows how top-heavy piracy consumption is with most activity in the Top 50 sites, and demonstrates that a Top 250 is a valid proxy for piracy overall.

Direct effect of site blocking

To understand the effect of site blocking on the targeted domains it is useful to start by looking at the direct impact on the sites themselves. Tracking Alexa data by territory enables INCOPRO to examine the trends in popularity and estimated usage. INCOPRO translates this Alexa data into Alexa estimated usage, which can give an indication of the usage of a given site in real terms (see *Appendix A: Methodology*). The graphs in part one of the report therefore show the Alexa estimated usage of the blocked sites in relation to before they were blocked.

Group 1

The first order obtained in Australia targeted 65 domains relating to 5 sites, with an implementation date of December 2016 (a full list of all domains subject to blocking in the country has been included in *Appendix B*). The stacked bar chart below shows the Alexa estimated usage in Australia for the sites included in this blocking order, as well as the extension orders which are represented by the dotted lines. It is important to note that proxy Pirate Bay domains were the main target of these follow-up blocks, however, proxy usage of all blocked groups is considered in the following proxies section and has not been included in the analysis below for this reason.

As has been the case for some time, only 2 of the blocked sites record Alexa estimated usage data in April 2018 - due to 3 of the sites having shut down: SolarMovie, Torrentz and TorrentHound. Since the previous report, which looked at usage up until November 2017, usage of the group has decreased 6.7% further (from 69.4% to 76.3%).

ISOHunt usage has continued its downward trend since December 2016, and is now at its lowest on record having reduced by 98.6% since blocking began. This is the result of an additional 2.2% reduction from the 96.4% reported for the site in November 2017.

The Pirate Bay continues to account almost solely for a majority of group 1 usage, and is responsible for 99.7% of the groups 193,266 total usage in April 2018. Blocking has clearly had a significant impact on the site, with usage having reduced by 75% since December

2016, an additional 7.1% from the 67.9% reduction reported in November 2017. The gradual rise in usage of the site seen since the immediate impact of blocking has reversed, with usage showing a downtrend from August 2017 onwards. It is likely that the repeated blocking variations indicated in the graph have worked to make the blocking of this group more effective by making it harder for usage to shift to alternative sites.

Group 2

Group 2 blocks were implemented in April 2017, targeting 7 domains relating to Kickass Torrents (full list of affected domains in *Appendix B*). The site was once the most popular torrent site globally, however, due to the site shutting down in July 2016 there is no discernible impact of the sites blocking in Australia – usage ceased for the blocked domains before the block was implemented.

Group 3

The first August 2017 blocking order to be covered in this report is that obtained by Roadshow. The order includes BitTorrent and video linking sites (full list in *Appendix B*), the usage of which is displayed in the graph below. As the dotted line depicts, an update to the blocking order was obtained in February 2018, resulting in 25 further domains being blocked.

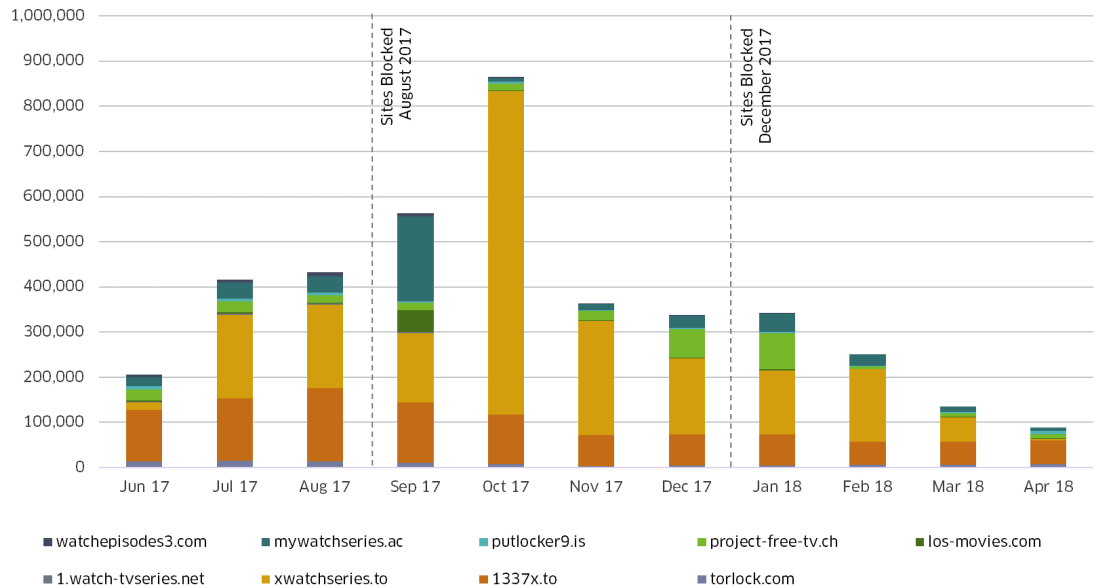

As the graph shows, the overall usage change figure has been affected by a rise in usage to 1 site in April 2018 – watch-series.is (dark purple). Overall, blocking of the group has been effective, with the total combined usage of the group having decreased by 67.1% when comparing April 2018 usage to before blocking began in August 2017.

Group 4

An order for another blocked group was also obtained by Foxtel in August 2017. The usage of affected domains is displayed in the graph below.

Group 4

Sites Blocked in August 2017

Usage of the group has decreased considerably since the October 2017 spike discussed in the previous report, and again since January 2018 – now at its lowest on record in April 2018. Overall, total usage of the group has reduced by 79.6% since blocking began in August 2017 (from 431,977 to 88,280).

As the graph shows, overall usage of the group has been affected by a decline in xwatchseries.to (gold). This is the result of an update to the blocking order in December 2017 which included two of the sites alternative domains. Usage of the two sites targeted in the blocking extension have decreased significantly since implementation, with ewatchseries.to usage having decreased by 99.6% and itswatchseries.to recording no usage in April 2018.

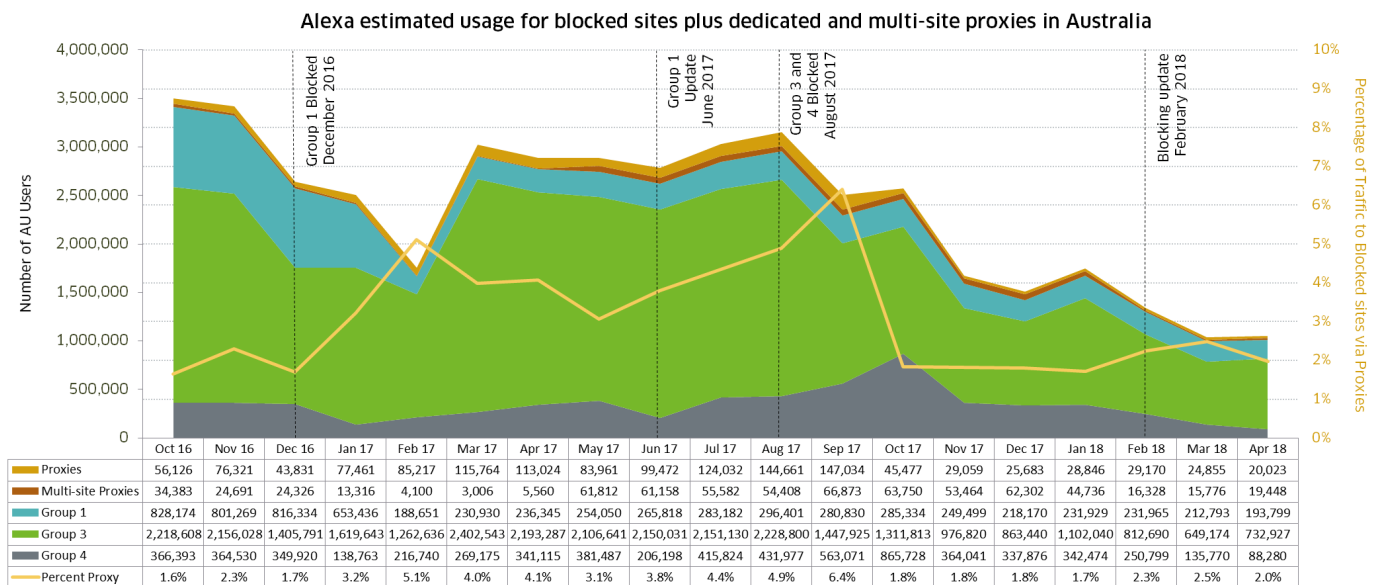

Proxy usage to circumvent website blocking

The analysis of the Alexa estimated usage for blocked sites detailed above did not include traffic going to proxies that were created to circumvent the ISP blocks. There are currently three types of site or service used to achieve this:

- 1) Dedicated sites offering access or a mirror of a specific blocked site
- 2) Sites offering access to more than one blocked site from one place ('multi-site proxies')
- 3) General purpose VPN or proxy services which offer access to any site

INCO PRO tracks all three categories; however, for the purposes of measuring traffic to unauthorised sites, only categories 1 and 2 have been considered in this report.² General purpose VPN and proxy services have been excluded because they allow users to access any website of their choice. As a result, it cannot be definitively concluded that they are being used to access unauthorised sites.

Although the potential for proxy use is ever present, in Australia it is only The Pirate Bay which receives noteworthy proxy usage. A number of proxies have now been blocked in the region, most notably in the June 2017 update to the group 1 order which targeted Pirate Bay proxies (full list of affected domains in *Appendix B*). The graph below shows the estimated usage for all dedicated proxies relating to blocked sites, including multi-site proxies and blocked site usage.

The graph shows a decrease in usage over time. The combined usage of blocked sites, proxies and multi-site proxies has decreased by 70.3% when comparing April 2018 to October 2016. This is a considerable change from the 53% reduction reported for November 2017 in the previous report. As the dashed lines indicate, there is a clear impact on usage in December 2016 when the first blocks in the country were implemented, in August 2017 when groups 3 and 4 were blocked, and in February 2018 when updates to the blocking orders were implemented.

² Please note that where a proxy is hosted on a subdomain of a popular site this is not currently tracked by INCO PRO. This is a result of the way in which Alexa data is collected and made available to us. Where a domain can be attributed to infringement, for example the multi-proxy site unblocked.tw, this is tracked at the domain level and the usage included in the analysis in this section.

Estimated usage of the blocked sites through dedicated proxies has decreased by 64.3% when comparing April 2018 usage to October 2016. This is a significant change from the 48.2% increase highlighted in the previous report. It should be noted that proxy usage relating to the blocked sites is entirely attributable to Pirate Bay proxies in April 2018, with no identifiable proxy usage found for the other blocked sites. As noted in the previous report, the update to the group 1 blocking order in June 2017 is the reason for the reduction in proxy usage. April 2018 usage of multi-site proxies has decreased by 43.4% since October 2016.

The combined usage of blocked sites and their dedicated proxy domains amounts to 1,035,028 in April 2018, which is a 70.2% decrease since October 2016, before any blocking began. The percentage of users using proxies to access blocked sites in April 2018 is 2%.

Appendix A: Methodology

The websites contained in this report are identified by INCOPRO's Infringement Index; sites that either infringe copyright or that facilitate infringement of copyright (whether knowingly or not), by making available films and television programmes to the public, without the licence or consent of the owners of the copyrights in those works. Tracking Alexa data globally and by territory enables examination of the trends in popularity and estimated usage of sites in the Identify database. INCOPRO translates this Alexa data into Alexa estimated usage, which can give an indication of the usage of a given site in real terms, as explained further below. The data set used for the Australian landscape is based on all sites tracked in the Identify database with recorded usage in Australia between October 2016 and April 2018 which is referenced throughout report.

INCOPRO is able to track all domains related to each individual site. The usage value attributed to alternate domains will be highlighted where necessary and included separately in any graphs, so the impact of the extra data available is clear. This improves the accuracy of the data for each site and is referred to as "alternate domain usage". The inclusion of this data helps to show where site operators are using other domains, not subject to blocking, to circumvent the blocks and continue to attract users.

Where sites have a number of domains that work in a similar way, these can be identified in the graphs where sites show a split bar of data or are otherwise marked as illustrating the alternate domain usage data. Any sites shown in the graphs with 2 plus signs ('++') next to their domain name represent those sites that are subject to current blocking orders in Australia.

For the purposes of the analysis in this report, 2 data sets have been used:

1. INCOPRO used a list of 420 sites that have been blocked in Australia. All active alternative domains and sites aimed at circumventing the blocking, i.e. proxies, have also been included. Where necessary a distinction has been made where these sites are blocked or unblocked in the country. The Australia Alexa estimated usage data covers the period from October 2016 up to the end of April 2018, providing a picture of the usage of these sites prior to the blocks, and then after the implementation of the blocks to assess their efficacy.
2. The top 250 unauthorised websites that make available film and television content available to Internet users in Australia without the licence or consent of the companies that are responsible for the production and distribution of such films and television programmes. Some of these sites may also make available other copyright content, such as The Pirate Bay. Sites that do not make available film and television content have not been analysed in this report. The top 50 unauthorised sites in Australia have been identified using INCOPRO's database of websites, Identify, and by reference to INCOPRO's "Infringement Index", combined with a usage metric derived from Alexa data, explained later in this appendix.

All sites were online at the time of data collection, but this is subject to change at any time due to the way in which these sites operate. It is also important to note that the 2 data sets described above are not mutually exclusive and have some overlap.

The data used to prepare these reports is manually reviewed prior to analysis to ensure its quality. The lists of blocked sites included in this analysis can be found in Appendix B.

Prior to 2008, Alexa traffic estimates were based solely on their browser toolbar, which users had to manually install on their computer. In 2008 Alexa announced that they were no longer relying solely on the toolbar data, and instead pulled in data from a variety of sources, including buying data from ISPs. Alexa's methodology has changed again over the past few years, which appears to coincide with Alexa launching their direct site measurement program (Alexa Certified Metrics). Alexa has removed all text from their information pages regarding buying data from ISPs/collecting from a variety of sources, and now state the following (paraphrased):

- Traffic estimates are based on data from their global traffic panel, a sample of all internet users. The panel consists of millions of users using toolbars created by over 25,000 different publishers, including Alexa and Amazon.
- Some sites are directly measured by Alexa – site operators can sign up to Alexa’s certified metrics program.
- Traffic Rank is a measurement of traffic to a website, relative to all other sites on the web and calculated using a combination of the estimated average daily unique visitors to the site and estimated number of page views.
- Alexa corrects for biases in the demographic distribution of site visitors, they correct for potential biases in data collected from the various browser extensions, to better represent the type of visitors who might not be in their measurement panel. That being said, biases still exist.
- Due to the concentration of visitors being on the most popular sites, it is difficult to accurately determine the rank of sites with fewer than 1000 monthly visitors. Therefore traffic rankings of 100,000 and above should be considered rough estimates. The closer a site gets to number 1, the more accurate its traffic ranking becomes.

Alexa’s collection methods and traffic data were presented and explained in court last year by INCOPRO’s Director of Technology, Bret Boivin. This evidence was accepted by the judge and formed an important part of the successful case against the defendant.

As there are several data providers that offer usage numbers for sites, and each provider applies a different methodology and draws data from different sources, INCOPRO has chosen to refer to the usage metric as an overall ‘Alexa usage estimate’. This is to avoid inconsistencies with other data sources, and because the focus of this report is concerned with the impact of enforcement as opposed to the number of users for particular sites.

To determine this usage metric, we translate the Alexa reach, which is expressed as number of users per million, for each site and user percentages into estimates of the estimated usage of a website. To do this, the global internet population has been obtained from the latest ITU Facts and Figures (published February 2013). Alexa reach data is tracked automatically by our system, along with several other key metrics. For this calculation, the reach data is used with the ITU figure to produce the usage metric.

Alexa also makes data available for territories individually where the website has enough traffic data in that country. This is expressed as a percentage of all users visiting the site. This percentage figure is used in conjunction with the above reach calculation to get the Alexa estimated usage metric for the site in a given territory. We take the above calculations on a day-by-day basis and then calculate the median value for the month for each site, for both the global and country calculations. Given the fluctuations in numbers that can occur as a site decreases in popularity, this is the best way to remove any dramatic increases or decreases.

This Alexa usage estimate is used to show trends in relation to particular sites. Sites relevant to all aspects of the piracy landscape, from legitimate services to proxies used to circumvent ISP blocking measures are dynamically tracked by INCOPRO. We can also confidently assess the impact on other sites that are in the same type of “piracy market” and that might be expected to benefit from blocking applied to other sites. Our confidence on this stems from the fact that the INCOPRO system has tracked blocked sites and the key other piracy sites for a substantial period and has also tracked all known proxies for such sites. This tracking has had to be meticulous because the tracking is then used to notify ISPs of site and proxy domains to be blocked. More data sources are being identified and included in INCOPRO’s Site Intelligence Database (Identify) in the coming months, which will increase the data points available for comparison.

In this report, ‘top x sites’ refers to the most popular sites that are responsible for, or enable, the infringement of copyright in film and television content, as tracked by INCOPRO. The data used to prepare these reports is manually reviewed prior to analysis to ensure its quality.

Appendix B: Sites blocked in Australia

The Australian site blocking efficacy reports consider the impact of all site blocking injunctions undertaken in the country. Appendix B includes all sites blocked in the country to date (including those which were not analysed in this report but will be analysed in future reports), as they appear in the blocking order.

Group 1 – December 2016

The first group of blocked sites contains 65 domains relating to 5 main sites which were ordered to be blocked in December 2016. Both unauthorised sites and the proxies that relate to them have been reproduced in full below, as they appear in order:

Name	Host	Name	Host
The Pirate Bay	thepiratebay.se	The Pirate Bay	thepiratebay-proxy.com

Group 1 – December 2017

A further 4 Pirate Bay domains were added to the order in December 2017.

Name	Host
The Pirate Bay	thepiratebay-proxlist.org
The Pirate Bay	proxybay.one
The Pirate Bay	thepiratebayproxylst.net
The Pirate Bay	themirrorbay.com

Group 1 – February 2018

An additional 5 Pirate Bay proxy domains were added to the blocking order in February 2018.

Name	Host
The Pirate Bay	pirateproxy.cam
The Pirate Bay	pirateproxy.cc
The Pirate Bay	pirateproxy.cat
The Pirate Bay	hyperproxy.net
The Pirate Bay	pirateproxy.site

Group 1 – April 2018

An extension to the order obtained in April 2018 added 11 additional sites.

Name	Host
The Pirate Bay	piratepiratepirate.com
The Pirate Bay	tpb.tw
The Pirate Bay	thehiddenbay.ws
The Pirate Bay	thehiddenbay.fi
The Pirate Bay	thepiratebay.blue
The Pirate Bay	thehiddenbay.cc

Name	Host
The Pirate Bay	pirateproxy.sh
The Pirate Bay	thepiratebay3.org
The Pirate Bay	piratebayproxylst.net
Torrentz	torrentz2.is
Torrentz	torrentz2.me

Group 2 – April 2017

The second wave in Australia was obtained by the music industry and ordered to be blocked in April 2017. The injunction concerns 7 Kickass Torrents domains, shown in full below:

Name	Host
Kickass Torrents	kat.al
Kickass Torrents	kattor.xyz
Kickass Torrents	kickass.cd
Kickass Torrents	kickass.immunity.date
Kickass Torrents	kickass.pe
Kickass Torrents	kickass.ukbypass.download
Kickass Torrents	kickass.unblocked.tv

Group 3 – August 2017

The third group of blocked sites contains 83 domains which relate to various BitTorrent and linking sites, as detailed below:

Name	Host	Name	Host
KissCartoon	kisscartoon.se	ExtraTorrent.cc	extra2.to
KissCartoon	kisscartoon.me	ExtraTorrent.cc	extratorrent.cc

Appendix C: Relative Size across Top 250 Piracy Sites

Top 250 site usage in Australia by Alexa estimated usage

Site 1 - 250

April 2018

As the graph shows, there is a significant difference between the highest usage sites when compared to the long tail formed by the lower usage sites in the top 250. The bottom site in the top 250 only amounts to 0.5% of the usage of the highest usage site (1,021 compared to 219,834).
